

Burndown Chart

Write your comments about the burndown chart in this document.

No tasks were closed in the first week, then two tasks were closed early in week two. The remaining tasks started being closed one at a time later in the week. This is partly due to the assignment 2 deadline at the start of week two. More importantly, this sprint includes features that require a lot of research prior to implementation. As a result, tasks related to emails, locations, and pictures were completed on the final day.

Also compare the planned velocity with the previous sprint velocity. Explain why your velocity did change (or why did not change).

This sprint has 40 points whereas sprint 3 had 36. This is a further increase in the amount of work taken on and completed by the team. The increase in the velocity is primarily due to an increased understanding of and comfort with the technologies used and the application in general. Moreover, we were able to learn from our experiences in the previous sprints and better organize and manage our work and time in this sprint.
